

Easy Inventory

IT Asset Management in Cloud with Geolocation

The proposal is to offer a complete IT Asset Management service in Cloud extremely easy, automatic, fast and low cost, accessible to all sizes of companies, without the need of a specialist and without investments in infrastructure.

How it works

- 1** Through a resident Agent, Easy Inventory automatically collects hardware and software data from your equipment.

The data are sent to a cloud server and immediately available on a personalized website for consultation and management of your assets.

2**3**

It allows you to consult details of:

Hardware and Software Settings

Installed software licenses

Location of physical equipment(Geolocation)

The Main Differentials

Geolocation

All equipment (Servers, Desktops, Laptops, Tablets and Smartphones) will have their physical location registered, making this data accessible in reports and specific graphics (Google Maps) or to export in Excel.

Geofence

Unlimited fences can be created, with multiple locations, whenever a device (Windows and Android) leaves or enters the defined perimeters, an Alert will be registered and sent by e-mail to a responsible person. Allowing total control over the movement of all assets.

Traceability

All equipment (Servers, Desktops, Laptops, Tablets and Smartphones) will be tracked daily and permanently, our records will show the geolocation of the last 6 months.

It is not necessary to install any hardware with GPS on those desktops and notebooks, the identification of Geolocation is done entirely by software.

Automatic Alerts

Automatic alerts will be set up so that you receive notifications (emails) as soon as changes deemed critical are detected, such as: changes in hw, installation or uninstallation of Sw, Geofence limits, slow equipment, CPU consumption, space in disc, expiration of warranty, contracts and much more.

This resource becomes indispensable for IT Asset Management, as it is impossible to know precisely the changes that occurred in the environment manually.

IT Asset Management in Cloud
with Geolocation

Software License Control (SAM)

We show the use of licenses identifying all irregularities. You will be able to control the expiration and costs of all licenses. It is possible to identify the installed and unused licenses (Sw metering), allowing the relocation or uninstallation of them, optimizing costs.

Unauthorized software and Apps (Blacklist) will be identified, improving users productivity

Software Deploy

With Easy Inventory you can install and uninstall software on a massive scale, creating standards for your entire company quickly and efficiently, even if the equipment is outside your local network.

It also enables you to set up installation and uninstallation by equipment groups.

Remote Access (Sold separately)

It will be possible to remotely access via the Internet or local network, share the desktop, conference online through a chat room, and also transfer files between the connected equipment.

With this feature you will be able to generate savings in time and travel costs, increasing productivity.

API

The Rest API is a set of web services that provide an interface to query the information contained in the Easy Inventory database.

With this feature, you can access any Easy Inventory data to integrate into any database in your company, such as CMDB, BI, Power BI, ERP and much more.

with Geolocation

Performance Analysis

For Servers, Laptops and Desktops: our Agent will permanently capture the CPU and memory usage of all equipment, showing those with critical performance or overloaded.

With this information, it will be possible to identify slow equipment, show the root cause of eventual equipment slowdown and the maximum and average CPU temperature will also be shown.

Term of Responsibility

The digital Term of Responsibility brings several advantages to the companies.

Firstly, efficiency is increased, since paper documentation takes time and resources to store, organize and retrieve. With the digital version, documents can be easily accessed, shared, and securely archived. Meeting one of the requirements of the LGPD.

Messaging

The proposal of the messenger service is to evolve the ease of communication in your company. More direct than an e-mail and with more possibilities of visualizations and configurations, the biggest difference is that through this solution, the user sees the newsletters directly on his desktop, bringing him closer to the information.

Depreciation

Through the Linear method, the depreciation of the Assets will be permanently calculated, where through a specific report the status of the depreciation (total or pending with the balance) will be shown.

IT Asset Management in Cloud
with Geolocation

Peripherals Discovery

With this feature will be identified all equipment that have some IP in your network, as well as equipment such as routers, printers, scanners, IP phones, will be shown and can be classified and sent to the registration of peripherals

SSO Login Authentication

Single Sign-On (SSO) is an authentication and authorization method that allows a user to log in with a single ID. It is a tool that gives more convenience and security to the day to day, integrated with your AD (Active Directory).

Contract Control

Any type of contract can be registered, including with suppliers, with the main data: start/end dates, values, etc. and also attach a scanned copy.

An Alert will be generated 30 days in advance notifying you of the expiration.

Supply Control

Details of all IT supplies, stock quantities, minimum stock, and stock levels.

With specific areas to register incoming and outgoing supplies, registration of supply types and various stock locations.

Unique alert for when the minimum stock falls below the defined limit.

Characteristics

- ✓ Cloud Service
- ✓ "Lightweight" agent generating low CPU and traffic consumption and traffic when sending data
- ✓ Accurately inventories hw and sw data in seconds
- ✓ Environments: Windows, Linux, MacOS, Chrome, iOS and Android
- ✓ Makes the Geolocation and traceability of all equipment (Laptops, Desktops and Servers)
- ✓ Electronic Fence
- ✓ More than 30 automatic alerts
- ✓ Software license control (SAM)
- ✓ Control the expiration of software licenses
- ✓ Software metering
- ✓ Points out the use of prohibited softwares (Blacklist)
- ✓ Software Deploy, install on a local network or over the Internet
- ✓ Remote Access
- ✓ API for integration with any external system
- ✓ Identifies equipment with low performance and the causes of slowdowns
- ✓ Controls thefts and robberies of equipment or components
- ✓ Allows remote formatting of equipment in case of loss or theft
- ✓ USB Lock
- ✓ Multi-company
- ✓ Term of responsibility
- ✓ Messaging
- ✓ Allows unlimited listing of administrative fields
- ✓ Allows unlimited cataloging of peripherals: printers, routers, scanners, lps phones
- ✓ Allows unlimited PDF and JPG file uploads to document all assets
- ✓ Performs integration and auditing on Microsoft AD users
- ✓ SSO Login Authentication
- ✓ Controls the equipment in stock and maintenance
- ✓ It controls contracts, with expiration alerts
- ✓ Controls the expiration of the equipment's warranty
- ✓ Supply Control
- ✓ Control the depreciation of all equipment
- ✓ Controls preventive maintenance
- ✓ Controls the physical health of the disks
- ✓ Dashboard with various reports and graphs
- ✓ BitLocker Status Control
- ✓ Secure Boot Status Control
- ✓ English, Portuguese and Spanish versions
